COMBINING NORMAL DISTRIBUTIONS

If we have independent Normal random variables, then the sum (or other linear combination) of these Normal random variables is ALSO Normal

If

\[ X_1 \sim N(\mu_1, \sigma_1), X_2 \sim N(\mu_2, \sigma_2), \ldots, X_n \sim N(\mu_n, \sigma_n), \]

and \( X = \sum_{i=1}^{n} X_i \), then

- \( X \sim N(\mu, \sigma) \)
- \( \mu = E[X] = \sum_{i=1}^{n} \mu_i \)
- \( Var(X) = \sum_{i=1}^{n} \sigma_i^2 \)
- \( \sigma = SD(X) = \sqrt{Var(X)} = \sqrt{\sum_{i=1}^{n} \sigma_i^2} \)
EXAMPLE 1

Let $X_1$, $X_2$ and $X_3$ be independent Normal random variables, where

$X_1 \sim N(\mu = 4, \sigma = 2), X_2 \sim N(\mu = 3.1, \sigma = 7), X_3$

1. If $Y = X_1 + X_2 + X_3$, then what is the distribution of $Y$? Find the 83rd percentile of $Y$

2. Let $K = 2X_3 - X_2 + \frac{1}{3}X_1$, What is the distribution of $K$
NORMAL APPROXIMATION TO THE BINOMIAL

If a Binomial distribution has a large enough combination of n and p, it behaves much like a Normal distribution, which means we can use the Normal distribution to approximate the original Binomial distribution

- If $X \sim Bin(n, p)$, and $np > 5, n(1 - p) > 5$
- Then we can use $X^* \sim N(\mu = np, \sigma = \sqrt{np(1 - p)})$, to approximate $X$

You may notice that Binomial is Discrete, and Normal is Continuous. This means the approximation comes at a cost of accuracy that we must try to correct. When we use the approximation, we need to perform a continuity correction:

- If you’re looking for: $P(a \leq X \leq b)$
- Use $P(a - 0.5 < X^* < b + 0.5)$
EXAMPLE 2

A class has 400 students, and each drops the course independently with probability 0.07. Let $X$ be the number of students that finish the course

1. Find $P(370 \leq X \leq 373)$, what is the exact distribution of $X$?
2. Any approximation?
